

## Instructions

Download the answer document. Be sure to put your name at the top of the answer document where that's indicated. Answer the questions below in that document and when you are done, upload it into Blackboard.

All your writing must be your own original words. You may not cut-and-paste something you find on the web. If you like something you've found on the web you need to put it into your own words.

Note: In the workplace it is important to write concisely. If you get too long-winded people simply will not read what you've written. In that spirit, for each of these questions individually, do not write more than a half page double spaced for each.

## Steps

1. [5] Describe the basic responsibilities of a database administrator. For each one, give its name along with a description of the responsibility. You don't need to use all the rows in the table.
2. [5] Describe the log files that administrators control. For each one, give its name along with a description of the log file. You don't need to use all the rows in the table.
3. [5] If you were in charge of securing the College database we've used in this course, what roles/groups would you identify? Think of the specific roles people play in a college. What privileges would you set up for each? Be sure to explain why you'd set them up that way. I know you'd use the GRANT statement. Tell me what you'd do, don't tell me how you'd do it. You don't need to use all the rows in the table.
